LogBox is also part of the ColdBox Platform suite of services and libraries and allows you to easily build upon it's logging framework in order to meet any logging or reporting needs your applications has.

LogBox surpasses ColdFusion's very basic cflog tag. LogBox allows you to create multiple destinations for your loggings and even configure multiple destinations or change them at runtime. Almost every application needs logging and/or tracing capabilities and we have developed LogBox to satisfy these needs.

LogBox was inspired by the original logging capabilities in ColdBox and in the Log4J project.

ColdBox is a conventions-based MVC development framework for ColdFusion (CFML). It provides a set of reusable code and tools that can be used to increase your development productivity as well as a development standard for working in team environments.
